HG4041 Theories of Grammar

Introduction, Organization First attempts at a theory of grammar

Francis Bond

Division of Linguistics and Multilingual Studies

http://www3.ntu.edu.sg/home/fcbond/bond@ieee.org

Lecture 1 Location: LHN-TR+36

Overview

- > Syllabus; Administrivia
- > Prescriptive/descriptive grammar; Competence/performance
- > Some history
- > Why study syntax?
- > Two theories that won't work
- Context Free Grammars
- > Central claims of CFG

Administrivia

Coordinator Francis Bond <bond@ieee.org> !<fcbond@ntu.edu.sg>

All other details on the web page

100% Continuous Assessment

- ➤ Mid-term (20%)
- > Final (20%)
- > Group Project: Presentation (20%)
 - > Give a precise and explicit model of some phenomenon not covered in class
 - > The talk must motivate the choice of phenomenon
 - You need only cover existing work
 - ➤ In-class presentation with slides or handouts, not to exceed 17 minutes (12 presentation, 5 QA)
 - > You should choose something relevant to your final project if possible

➤ Individual Project (40%)

- > Give a precise and explicit model for some phenomenon not covered in class
 - * You should give attested and constructed examples
 - * You should clearly indicate what you can and can't explain
 - * It is expected that you can not explain everything perfectly
 - * Your model should make clear predictions
- The paper must motivate the choice of phenomenon
- > You should cover relevant existing work and add something new
- LMS format, not to exceed 12 pages

Guidelines for Written Work in LMS

- > All assignments must follow the Guidelines to Submitting Written Work for the Division of Linguistics and Multilingual Studies
 - You can get it from: http://www.soh.ntu.edu.sg/Programmes/ linguistics/studentresources/Documents/Linguistics%20Assignment% 20Guidelines.pdf
 - * except: single spaced, double-sided
 - > Useful advice on citation, transcription, formatting
 - ➤ I also recommend my own (Computational) Linguistics Style Guide: www3.ntu.edu.sg/home/fcbond/data/ling-style.pdf
 - > Proper citation is important
 - failure to cite is plagiarism fail subject
 See the NTU code of academic integrity
 http://www.ntu.edu.sg/ai/Pages/index.aspx

What do you learn?

On completion of this module, students should be able to:

- > Recognize certain classes of syntactic phenomena
- Build analyses of those phenomena in a precise framework
- > Apply the process of building a formalized analysis to test linguistic hypotheses
- > Know a little about different approaches to the study of syntax

Textbook and Readings

> Textbooks

- ➤ Sag, Wasow and Bender 2003 *Syntactic Theory: A Formal Introduction* 2nd ed. CSLI (**required**)
- > You should read all chapters assigned before class.
- > Ideas from the book will be pursued in parallel with the topics given above.

Student Responsibilities

By remaining in this class, the student agrees to:

- 1. Make a good-faith effort to learn and enjoy the material.
- 2. Read assigned texts and participate in class discussions and activities.
- 3. Submit assignments on time.
- 4. Attend class at all times, barring special circumstances (see below).
- 5. Get help early: approach us when you first have trouble understanding a concept or homework problem rather than complaining about a lack of understanding afterward.
- 6. Treat other students with respect in all class-related activities, including on-line discussions.

Attendance

- 1. You are expected to attend all classes.
- 2. Be on time lateness is disruptive to your own and others' learning.
- 3. Valid reasons for missing class include the following:
 - (a) A medical emergency (including mental health emergencies)
 - (b) A family emergency (death, birth, natural disaster, etc).

You must provide documentation to me and the student office.

- 4. There will be significant material covered in class that is not in your readings. You cannot expect to do well without coming to class.
- 5. If you miss a class, it is your responsibility to get the notes, any handouts you missed, schedule changes, etc. from a classmate.

Remediation and Academic Integrity

- 1. No late work will be accepted, except in the case of a documented excuse.
- 2. For planned, justified, absences on class days or days on which assignments are due, advance notice must be provided.
- 3. Cheating will not be tolerated. Violations, including plagiarism, will be seriously dealt with, and could result in **a failing grade for the entire course**.
- 4. For all other issues of academic integrity, refer to the University Honour Code
- 5. As always, use your common sense and conscience.

The winning strategy

- > Read the books before class (and after again, if necessary)
- > Work together: make study groups
- > Homework: Discuss as much as you want, write up your own answers
- > Exams: No discussion
- ➤ Ask questions ...early and often!

Resources

- Glossary at back of textbook
- Grammar summaries and Appendix A
- > Answers to exercises at back of book
- > Each other, grad-students, office hours, ...
- ➤ Online:
 - > English Resource Grammar: http://erg.delph-in.net/logon
 - ➤ Wikipedia page has lots of links

Two Conceptions of Grammar

> PRESCRIPTIVE

- > Rules against certain usages. Few if any rules for what is allowed
- Proscribed forms generally in use
- Explicitly normative enterprise

> DESCRIPTIVE

- Rules characterizing what people do say
- > Goal to characterize all and only what speakers find acceptable
- > Tries to be scientific

Uses of Grammar

> PRESCRIPTIVE

- ➤ Identify speaker's socioeconomic class & education level
- ➤ Identify level of formality of a particular usage

> DESCRIPTIVE

- ➤ Understand how people produce & understand language
- ➤ Identify similarities & differences across languages
- > Development of language technologies

Prescriptive grammar

> Examples of silly prescriptive rules?

> Examples of useful prescriptive rules?

> Some applications which might need to encode prescriptive rules?

Fill in the blanks:

he/his, they/their, or something else?

- (1) Everyone insisted that _____ record was unblemished.
- (2) Everyone drives _____ own car to work.
- (3) Everyone was happy because _____ passed the test.
- (4) Everyone left the room, didn't _____?
- (5) Everyone left early. _____ seemed happy to get home.

Descriptive Grammar: an example

- (6) *F______ yourself!*
- (7) *Go f_____ yourself!*
- (8) *F______ you!*
- (9) *Go f_____ you!
- > Who taught you this?
- > How did you learn it?

Kinds of Things We'll Worry About

- \rightarrow Where to use reflexives (e.g. *myself*) vs. ordinary pronouns (*I*, *me*)
- > Agreement (e.g. We sing vs. *We sings)
- ➤ Word order (e.g. *Sing we)
- > Case (e.g. *Us sing)
- > Coordinate conjunction (e.g. We sing and dance)
- > How to form questions, imperatives, negatives, ...
 - ... and much more

Competence vs. Performance

- > The Distinction
 - Competence knowledge of language
 - Performance how the knowledge is used
- > Examples
 - (10) That Sandy left bothered me.
 - (11) That that Sandy left bothered me bothered Kim.
 - (12) That that Sandy left bothered me bothered Kim bothered Jo.
 - (13) The horse raced past the barn fell.

Competence v. Performance

- (14) You are what you eat
- (15) You are what what you eat eats, too
- (16) You are what what what you eat eats eats, too

Acceptability vs. grammaticality

- > A sentence is **acceptable** if native speakers say it sounds good.
- > A sentence is **grammatical** (with respect to a particular grammar) if the grammar licenses it.
- > Linguists are sometimes sloppy about the difference.
- Some people argue that it should be modeled probabilistically rather than as a binary distinction
 - > It depends on individual speakers
 - > But we often want to model groups of speakers
 - ➤ It is good to combine judgments with attested data but language is infinite, so we may not find the example we need attested

Some History

- > Writings on grammar go back at least 3000 years
- ➤ Until 200 years ago, almost all of it was prescriptive
- > Until 70 years ago, most linguistic work concerned sound systems (phonology), word structure (morphology), and the historical relationships among languages

The Generative Revolution

- Noam Chomsky's work in the 1950s radically changed linguistics, making syntax central.
- Chomsky has been the dominant figure in linguistics ever since.
- The theory we will develop (HPSG) is in the tradition started by Chomsky, but diverges from his work in many ways.

Main Tenets of Generative Grammar

- Grammars should be formulated precisely and explicitly.
- > Languages are infinite, so grammars must be tested against invented data, not just attested examples.
- > The theory of grammar is a theory of human linguistic abilities.

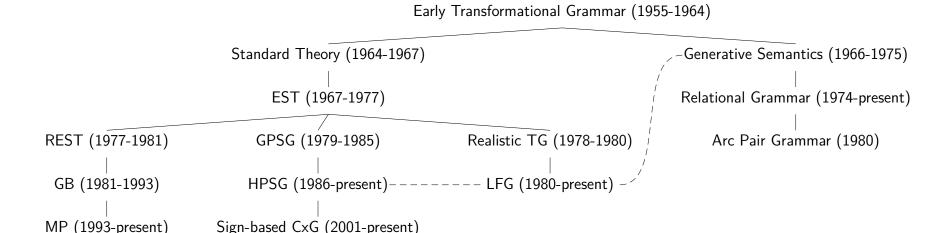

What does a theory do?

- Monolingual
 - Model grammaticality/acceptability
 - ➤ Model relationships between sentences (internal structure)
- > Multilingual
 - ➤ Model relationships between languages
 - > Capture generalizations about possible languages

Some of Chomsky's Controversial Claims

- The superficial diversity of human languages masks their underlying similarity.
- > All languages are fundamentally alike because linguistic knowledge is largely innate.
- The central problem for linguistics is explaining how children can learn language so quickly and easily.

Family Tree of Generative Syntactic Theories

- Many Other Theories
 - Dependency Grammar (links words not phrases)
 - Combinatory Categorical Grammar (allows multiple derivations)
 - Tree Adjoining Grammar (links subtrees)
 - Functional Grammar (considers function to be central)
 - * Systemic Functional Grammar
 - * Role and Reference Grammar

Why Study Syntax?

- > Why should linguists study syntax?
- > Should anyone else study syntax? Why?
- > Why are you studying syntax?

What makes a good model?

- generative: license all grammatical sentences and only them
 precise
- > explanatory: can explain generalizations
 - \succ the cat chased the rat \sim the rat was chased by the cat
 - > phrases tend to act like one member of the phrase
 - new information tends to come first/last
- concise: the model is as simple as possible
 - ⇒ universal

```
> tractable: the model can be modeled computationally
```

Our models are normally imperfect: we aim for iteratively improved approximations

(semantics) (headedness) (information theory)

(elegant) (minimal stipulations)

Insufficient Theory #1

> A grammar is simply a list of sentences.

> What's wrong with this?

Insufficient Theory #2: Regular Expressions

- (17) the noisy dogs left D A N V
- (18) the noisy dogs chased the innocent cats D A N V D A N
- > (D) A* N V ((D) A* N)

Regular expressions: a formal language for matching things.

Symbol	Matches
	any single character
*	the preceding element zero or more times.
?	the preceding element zero or one time: OR just $() = ()$?.
+	the preceding element one or more times.
	either the expression before or after the operator.

Context-Free Grammar

- ightharpoonup A quadruple: $\langle C, V, P, S \rangle$
 - C set of categories (α, β, \ldots)
 - V set of terminals (vocabulary)
 - P set of rewrite rules $\alpha \to \beta_1, \beta_2, \ldots, \beta_n$
 - S the start symbol $\mathbf{S} \in C$
- ightharpoonup For each rule $\alpha \to \beta_1, \beta_2, \ldots, \beta_n \in P$
 - $> \alpha \in C$
 - $ightharpoonup \beta_i \in C \cup V; 1 \le i \le n$

A Toy Grammar

> RULES

```
\begin{array}{ccccc} \textbf{S} & \rightarrow & \text{NP VP} \\ \text{NP} & \rightarrow & (\text{D}) \text{ A* N PP*} \\ \text{VP} & \rightarrow & \text{V (NP) (PP)} \\ \text{PP} & \rightarrow & \text{P NP} \end{array}
```

> VOCABULARY

D: the, some

A: big, brown, old

N: birds, fleas, dog, hunter, I

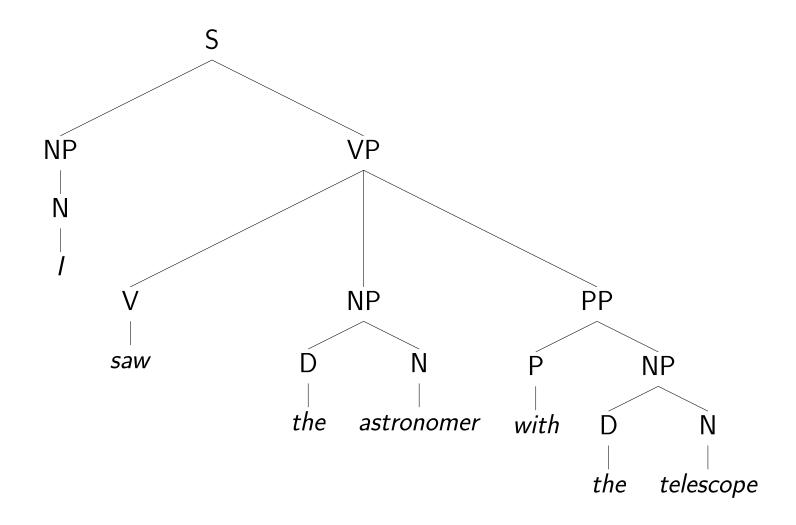

V: attack, ate, watched

P: for, beside, with

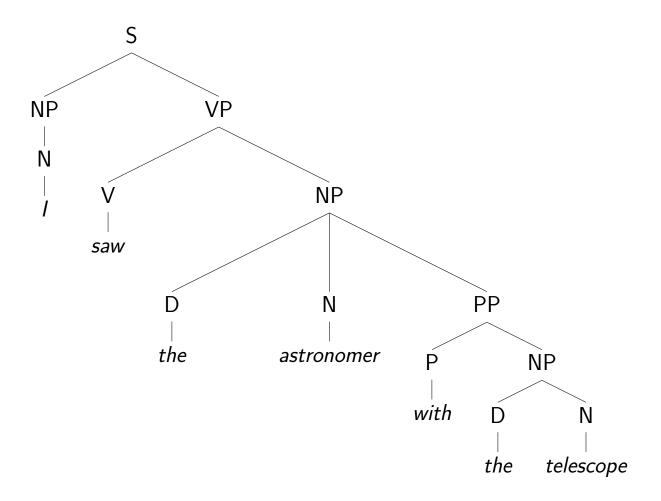

Structural Ambiguity

I saw the astronomer with the telescope.

Structure 1: PP under VP

Structure 2: PP under NP

Constituency Tests

- > Recurrent Patterns
 - (19) The quick brown fox with the bushy tail jumped over the lazy brown dog with one ear.
- > Coordination
 - (20) The quick brown fox with the bushy tail and the lazy brown dog with one ear are friends.
- Sentence-initial position
 - (21) The election of 2000, everyone will remember for a long time.
- > Cleft sentences
 - (22) It was a book about syntax that they were reading.

General Types of Constituency Tests

- > Distributional
- > Intonational
- > Semantic
- > Psycholinguistic
- ... but they don't always agree.

Central claims implicit in CFG formalism:

- 1. Parts of sentences (larger than single words) are linguistically significant units, i.e. phrases play a role in determining meaning, pronunciation, and/or the acceptability of sentences.
- 2. Phrases are contiguous portions of a sentence (no discontinuous constituents).
- 3. Two phrases are either disjoint or one fully contains the other (no partially overlapping constituents).
- 4. What a phrase can consist of depends only on what kind of a phrase it is (that is, the label on its top node), not on what appears around it.

- > Claims 1-3 characterize what is called **phrase structure grammar**
- Claim 4 (that the internal structure of a phrase depends only on what type of phrase it is, not on where it appears) is what makes it Context-Free.
- **Context-Sensitive Grammar** (CSG) gives up 4. That is, it allows the applicability of a grammar rule to depend on what is in the neighboring environment. So rules can have the form:

 $A \to X$ in the context of $\alpha _ \beta$ ($\alpha A \beta \to \alpha X \beta$)

Possible Counterexamples

- To Claim 2 (no discontinuous constituents):

 A technician arrived who could solve the problem.
- ➤ To Claim 3 (no overlapping constituents): I read what was written about me.
- > To Claim 4 (context independence):
 - (23) He arrives this morning.
 - (24) *He arrive this morning.
 - (25) *They arrives this morning.
 - (26) They arrive this morning.

Trees and Rules

 C_0 is a well-formed nonlexical tree if (and only if) C_1 ... C_2

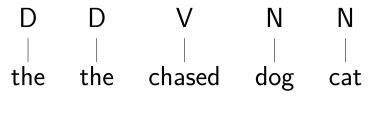

- $\succ C_0, \ldots, C_n$ are well-formed trees
- $ightharpoonup C_0
 ightharpoonup C_1 \ldots C_n$ is a grammar rule

Bottom-up Tree Construction

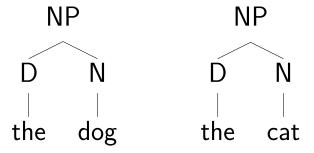

D: the

V: chased

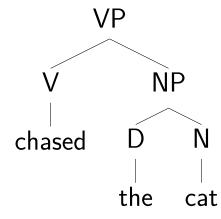

N: dog, cat

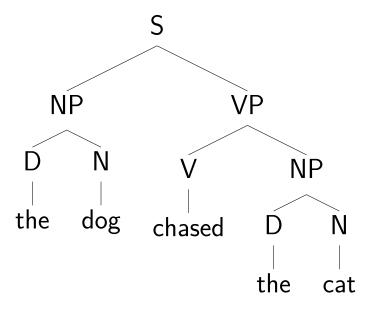

$$NP \rightarrow D N$$

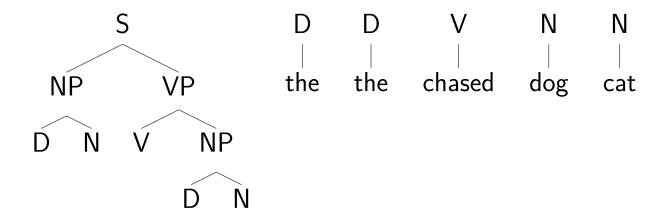

$$VP \rightarrow V NP$$

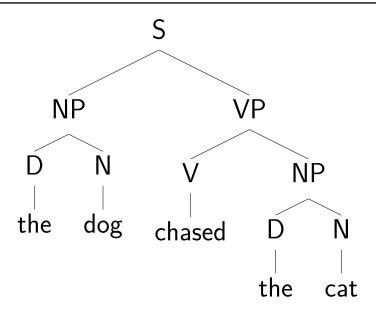

Top-down Tree Construction

- ightharpoonup: string ightharpoonup tree
- ightharpoonup Top-down: tree ightharpoonup string
- > CFG is **declarative** so it is independent of order

Weaknesses of CFG (atomic node labels)

- > It doesn't tell us what constitutes a linguistically natural rule
 - ightharpoonup VP o P NP
 - ightharpoonup NP o VP S
- > Rules get very cumbersome once we try to deal with things like agreement and transitivity.
- ➤ It has been argued that certain languages (notably Swiss German and Bambara) contain constructions that are provably beyond the descriptive capacity of CFG.

On the other hand ...

- > It's a simple formalism that can generate infinite languages and assign linguistically plausible structures to them.
- > Linguistic constructions that are beyond the descriptive power of CFG are rare.
- > It's computationally tractable and techniques for processing CFGs are well understood.

> CFG is the starting point for most types of generative grammar.

> The theory we develop in this course is an extension of CFG.

Transitivity and Agreement

- Consider the following transitivity examples
 - (27) The bird arrives
 - (28) The bird devours the worm
 - (29) *The bird arrives the worm
 - (30) *The bird devours
- > Consider the following agreement examples
 - (31) The bird sings
 - (32) The birds sing
 - (33) *The bird sing
 - (34) *The birds sings
- > Can we deal with them with a CFG?

Summary

- 1. Fundamentals
- 2. Investigate
- 3. Find out some stuff
- 4. Break our theory
- 5. Try to fix it.
- 6. Break it again.
- 7. Lather, rinse, repeat: we'll do that until we run out of time.

Jorge Hankamer's outline of a syntax course, but it's pretty applicable to everything we do. More formally: Successive Approximation.

Chapter 2, Problem 1

RULES

VOCABULARY

 $\mathsf{S} \qquad \rightarrow \quad \mathsf{NP} \; \mathsf{VP}$

 $NP \rightarrow (D) NOM$

 $VP \rightarrow V(NP)(NP)$

 $\mathsf{NOM} \to \mathsf{N}$

 $NOM \rightarrow NOM PP$

 $VP \rightarrow VP PP$

 $PP \rightarrow PNP$

 $X \rightarrow X + CONJ X$

D: a, the

N: cat, dog, hat, man, woman, roof

V: admired, disappeared, put, relied

P: in, on, with

CONJ: and, or

Chapter 2, Problem 1

- A Make a well-formed English sentence unambiguous according to this grammar
- B Make a well-formed English sentence ambiguous according to this grammar: draw trees
- C Make a well-formed English sentence not licensed by this grammar (using V)
- D Why is this (C) not licensed?

E Make a string licensed by this grammar that is not a well-formed English sentence

F How can we stop licensing the string in E (stop over-generating)

G How many strings does this grammar license?

H How many strings does this grammar license without conjunctions?

Shieber 1985

> Swiss German example:

```
(35) ...mer <u>d'chind</u> <u>em Hans</u> es <u>huus</u> <u>lönd hälfe aastriiche</u> ...we the children-acc Hans-dat the hous-acc let help paint we let the children help Hans paint the house
```

- Cross-serial dependency:
 - > lönd "let" governs case on d'chind "children"
 - > hälfe "help" governs case on Hans "Hans"
 - > aastriiche "paint" governs case on huus "house"
- > This cannot be modeled in a context free language

Strongly/weakly CF

- ➤ A language is weakly context-free if the set of strings in the language can be generated by a CFG.
- ➤ A language is strongly context-free if the CFG furthermore assigns the correct structures to the strings.
- > Shieber's argument is that SW is not weakly context-free and therefore not strongly context-free.
- > Bresnan et al (1983) had already argued that Dutch is strongly not context-free, but the argument was dependent on linguistic analyses.

Overview

- > Prescriptive/descriptive grammar; Competence/performance
- > Some history
- Why study syntax?
- Unsuccessful Attempts to model language
- > Formal definition of CFG
 - Constituency, ambiguity, constituency tests
 - Central claims of CFG
 - Order independence
 - Weaknesses of CFG
- ➤ Next Week: Feature structures

Acknowledgments and References
